Although there is an increasing number of pregnant individuals taking nutraceuticals to maintain good health, many gaps exist in the knowledge base. These nutraceuticals might be involved in a wide variety of biological processes, and the biological and epidemiological findings of relevant studies should be examined and analyzed. Nutraceuticals for Prenatal, Maternal and Offspring's Nutritional Health focuses on the role of nutraceuticals for prenatal, mothers, and offspring's health. In recent years, new trends have been established in this area of prenatal nutrition, that is, mother and offspring health based on appropriate nutrition during pre-pregnancy, pregnancy, and after pregnancy. Nutraceuticals and natural products have been used by many cultures and societies around the world. This book focuses on recent trends and potential clinical evaluations of such nutraceuticals and natural products. Features: Examines the role of Nutraceuticals on the mothers and offspring's disease and health Focuses on human population-based research Discusses role of nutraceuticals in placental development, nutraceuticals for gestational weight pain and post-partum obesity Covers nutraceuticals impacting uterine growth, gestational age, and mortality rate Explores the question whether Nutraceuticals intake in pregnant women is safe as they might be involved a wide variety of biological processes With 19 chapters written by established lead authors in this field,

Nutraceuticals for Prenatal, Maternal and Offspring's Nutritional Health addresses important findings of the latest scientific research regarding the role of nutraceuticals intake before and during pregnancy.

"This brief textbook of human development covers the events of

fertilization, gestation, and sex determination, followed by descriptions of the science of cloning, stem cells, and genome sequencing. The chapter covering the science is juxtaposed with a chapter discussing ethical questions that arise, such as when does life begin, should assisted reproductive technologies be regulated, and should parents be allowed to choose their child's sex"--Provided by publisher.

A Fully Revised and Updated Edition of the Award-winning Text Completely updated with the latest findings and statistical information available, the new Sixth Edition of this award-winning text continues to educate students about effectively controlling the spread of HIV and AIDS. Critical health communication scholars point out that the acceptance of HIV risk prevention methods are bound inside inequitable structures of power and knowledge. Nicola Bulled's in-depth ethnographic account of how these messages are selected, transmitted and reacted to by young adults in the AIDS-torn

population of Lesotho in southern Africa provides a crucial example of the importance of a culture-centered approach to health communication. She shows the clash between traditional western perceptions of how increased knowledge will increase compliance with western ideas of prevention, and mixed messages offered by local religious, educational, and media institutions. Buller also demonstrates how structural and geographical forces prevent the delivery and acceptance of health messages, and how local communities shape their own knowledge of health, disease and illness. This volume will be of interest to medical anthropologists and sociologists, to those in health communication, and to researchers working on issues related to HIV.

Research on the early human embryo has long been recognized as essential to progress in a host of biomedical areas from reproductive medicine to the treatment of pediatric cancers. Now, with the possibility of stem cell research and cell replacement therapies, embryo research holds out the promise of cures for many serious disease conditions such as diabetes and Alzheimer's disease. Despite its importance, however, human embryo research has met powerful opposition. Drawing on his experience as a member of the NIH's Human Embryo Research Panel, Green offers a first-hand account of the embryo research debates. In telling this story, he periodically pauses to reflect on some of the leading philosophical challenges posed by embryo research and new interventions at the start of life. Among the questions he examines are: What is the impact of new biological information on our thinking about life's beginning? May parents risk injuring a child in order to have it? What role should religion play in shaping biomedical policy in a controversial area like this? This is a fascinating insider's account of one of the most important, if unsuccessful, recent efforts to come to terms with a controversial area of scientific research.

AIDS

Excerpt from Comparative Anatomy and Embryology of Vertebrates as Aids in the Teaching of Human Anatomy in the Medical Course So much, briefly, for the connection of comparative anatomy with the practical laboratory course in embryology. If I may trespass further on your time, I should like

to point out what in our experience has proved the proper place for the introduction of comparative anatomy into the general course on adult human anatomy. I may state again, that in constructing the anatomical course at Columbia the guiding principle has been found in the conviction that the student will gain his lasting and valuable knowledge only by direct study of the cadaver. We have broken - I hope for good and all - with the didactic lecture in anatomy as commonly understood, and I may take a moment to outline our procedure, because it directly involves the question in hand. The first-year student attends no lectures in anatomy. During this year the instruction consists of practical demonstrations to small sections of the class, dealing with the anatomy of the extremities, the osteology, myology, and angiology of the head and neck, including the cervical plexus, and in direct connection with the demonstrations abundant practical work in the dissecting-room. The first-year student also attends a series of demonstrations forming what we term the Preliminary Visceral Course, designed to afford that general information regarding the body cavities and contents which is required for the correct appreciation of the instruction offered by the Departments of Physiology and Histology. In the second year, the laboratory work continuing, the student attends demonstrations to sections of the class in the anatomy of the central nervous system, organs of special sense, and cranial nerves. New Scientist magazine was launched in 1956 "for all those men and women who are interested in scientific discovery, and in its industrial, commercial and social consequences". The brand's mission is no different today - for its consumers, New Scientist reports, explores and interprets the results of human endeavour set in the context of society and culture.

AIDS continually presents new questions for the obstetrician and gynecologist. The effect on pregnancy, the possibility of perinatal transmission, HIV positive tests, and risk to staff are just a few of the issues confronting clinicians and practitioners today. These and other questions were addressed by the 19th Study Group of the Royal College of Obstetricians and Gynaecologists, whose findings are reported here.
