Introducing the Steel-Plate Composite Core - CE Center  
Composite construction of steel and concrete is a popular structural  
method due to its numerous advantages against conventional solutions.  
The optimal combination of the properties of the two most popular  
construction materials, i.e., steel and concrete, results in structures that  
are both safe and economic (Vasdravellis et al., 2012). In cable-stayed  
bridges, the composite concrete slab over the steel orthotropic deck  
provides a new option.

the time and effort needed for formwork placement, concrete casting,

step in structural evolution to address these concerns. ”
